I wrote a prototype app today that read "grouped data" from a JSON file. Example: [{"userId": 12345, "viewers": "Bob, Joe, Jane" }, {"userId": 2, "viewers": "Chris, John" }] My app had to do a lot of weird logic which I placed into a class called "GroupedData", and that class needed to know other classes like "User" to make sense. Thus, I put the GroupedData class into another class "GroupedDataUtil" to help itself by allowing another class, "GroupedDataGroup", to have a reference to a list of GroupedData. This is where I was introduced to a concept of "dependency injection", which I'd still like to know about. In doing so, I used a variable called "groupedData", but then I thought "Hey, that's a List" and I was surprised to see that the compiler did not complain, and instead seems to be happy with my variable of type List. I never called "add" or "remove" methods on the groupedData list because I didn't see the need for those. So is there a reason that I shouldn't have just used the variable of type "List" and had the compiler complain? A b7e8fdf5c8

It is an extension to LaTeX that allows the inclusion of bibliographical references. Since you may be asked to check this in a contract, you should be familiar with the standard LaTeX forms. I highly recommend taking a look at the LaTeX Style Guide for Authors which will give you a short introduction to the appropriate LaTeX commands to be used (unless I have done it wrong). Be careful.
